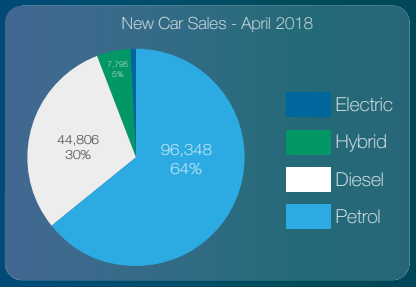
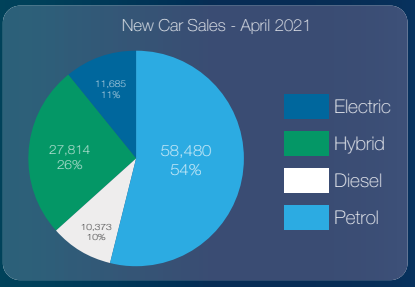
EV MARKET

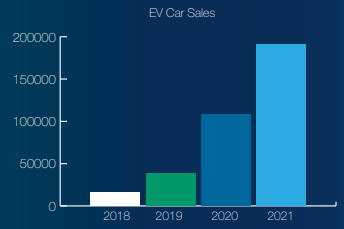
Electric vehicles enjoyed a record year in 2021 for car sales in the UK against a market place which was 28.7% below pre-Covid levels. Overall, 1.65 million new cars were registered in 2021 (1% up on 2020) due to the ongoing impact of the pandemic and the global semiconductor chip shortage.
Despite this, more battery electric vehicles (BEV) were sold than over the previous five years combined (2016 – 2020), with 190,727 registrations (11.6% of all new car sales), while plug-in hybrid vehicles (PHEVs) made up 7% / 114,554 cars. This means that 18.5% of all new cars registered in 2021 can be plugged in.

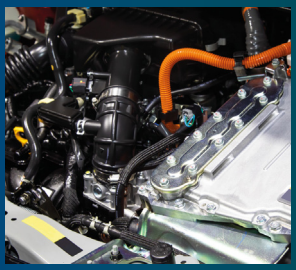




BEV sales grew again in January with 14,433 being sold making up 12.5% of all new registrations. This trend continued in February with a market share of 17.7% of all new registrations.
March 2022 saw the highest volume of BEV registrations ever being recorded in a single month with 39,315 new zero emission cars leaving the dealerships – an increase of 78.7% on March 2021.
In fact March 2022 witnessed more BEV being registered in March 2022 than during the whole of 2019 which now gives them an overall market share of 16.1%.
According the latest vehicle stats, the EV market is booming. Electric passenger car sales increased by 186% in 2020 and today there is 432,000 electric vehicles on the road in the UK and more than 750,000 plug-in hybrids.

There's been a massive increase in the number of electric vehicles on sale in the UK with more than 40% of models now available as plug-ins. Car manufacturers like Nissan, Tesla, Ford & Vauxhall have all expanded their offerings. Volkswagen have created their electric only ID. range and Mercedes Benz have launched their EQ models.





The institute of the Motor Industry (IMI) has warned that workshops and garages do not currently have the skills and the pipeline talent needed to service and repair electrified vehicles. The original report in May 2021 stated that the UK had just of 6% of garages equipped for E V vehicles.

With the UK garages having this major shortfall serious investment will be required. Each technician will need to be equipped with the correct clothing, protection & tooling to be kept safe at all times. Having your own 'EV kit' is no different to apprentice mechanics investing in their tool kits when starting out.

MAINTENANCE

VEHICLE SHUT DOWN - LOCK-OUT PROCEDURE

- Identify the vehicle – The most obvious and instant indication is the badge on the vehicle. As well as the badges on the exterior of the vehicle, there are a number of internal differences. An electric or hybrid vehicle will have a digital display to show battery / energy levels. Plus the vehicle will not have a gear stick as there is no gearbox. The vehicle will have a 'paddle' or 'selector'.
- Before starting the vehicle 'shut down' please check the vehicles operating manual. ALL makes and models have a 'safe time' that needs to be followed to allow the vehicle shutdown correctly keeping all the manufacturers data along with making the vehicle safe.
- Before starting any work on the vehicle please ensure the vehicle has all the correct safety coloured chains & posts around the vehicle to identify it to others.
- Ensure you have the correct PPE protection on before identifying the power points / voltage or carrying out any work on the vehicle.

WORKING ON THE VEHICLE

VEHICLE SHUT DOWN - WORKING SAFELY

- Before commencing any work on the vehicle please ensure the vehicle is safe to do so.
- There are special procedures for working on electric vehicles and the technician needs to be suitably qualified.
- High voltage is dangerous and can cause burns, shocks, sparks, explosions and even fires.

WORKING ON THE VEHICLE

GENERAL DAY TO DAY ACTIVITIES

- Ensure the vehicle's key is kept away from the vehicle to prevent accidental operation, ideally being locked away utilising the 'lock-out' cabinet.
- Before carrying out any maintenance visually check the vehicle for signs of damage to high voltage cabling (usually coloured orange) or any electrical components.
- Unless a specific task requires the vehicle to be energised always isolate or disconnect the high voltage battery in accordance with the manufactures instructions.
- Even when isolated, vehicle batteries and their components may still contain large amounts of energy and retain a high voltage. Only suitable tools & test equipment should be used. You must always test and prove that any high voltage cable or electrical component is dead prior to carrying out work.
- Pressure washing has the potential to damage high voltage electrical components and cables. Refer to guidance from manufacturers before valeting in any under body areas.
- Avoid towing any E&HV vehicles unless it can be determined that it is safe to do so. Dangerous voltages can be generated by movement of the drive wheels.
- Determine the location of high voltage cables before carrying out tasks such as panel replacements, cutting or welding plus taking appropriate precautions to prevent them being damaged

VEHICLE WARNINGS & INSPECTION

VEHICLE DANGERS

- Voltages present in electric and hybrids are significantly higher (up to 650 Volts direct current -DC, than those used in other vehicles 12/24 Volts DC. In dry conditions, accidental contact with parts that are live at voltages above 110 Volts DC can be fatal.
- Not only is it important to check the vehicle is safe to use but its also important to regularly check your PPE equipment for damages as even a 'pin prick' sized hole in your gloves will cause serious injury as electricity will find its way through as it earths.

ROADSIDE RECOVERY

INCIDENT RESPONSE

- Identify the vehicle and asses the risks for the technician, general public & other rescue services.
- Only approach the vehicle whilst wearing the correct PPE.
- Look for visual damages to bodywork and high voltage cabling.
- Check to see if the battery has been compromised. If the vehicle is smoking deploy the fire blanket.
- Once safe to do so remove the key from the vehicle to prevent it being activated / started.
- Sign off the area to prevent any unauthorised access.
- If the vehicle is damaged, faulty, and it's safe to do so, isolate the high voltage battery system using the isolation device on the vehicle. Always refer to the manufacturer's instructions for guidance.
- Have access reliable source of information for specific vehicle types.
- Avoid towing electric or hybrid vehicles unless it is determined to do so.

Gaither bead vice™

- Gaither's Bead Vice™ is a patented product that was designed to accommodate the new EVA wheels that first appeared in Europe several years ago.
- The trend in Europe, and recently throughout the world, has been to move towards using disc brakes on all large commercial vehicles.
- These disc brakes require a special wheel assembly that allows for more cooling and protection for the valve stem.
- These wheels are referred to as the EVA (external valve assembly) or "Hump" wheels.
- To protect the valve stem, a "hump" was built just inside the flange of the wheel making it impossible to break the bead loose from the wheel and therefore dismounting the tyre without the help of the Bead Vice™.
- • The patented Bead Vice™ quickly and safely break the bead free on all new EVA wheels.
- • Bead Vice™ BV-04 Includes:
  • 1 Bead ViceTM
  • 1 gallon (3.8 litres) of Super Slick'em™
  • applicator bottle.

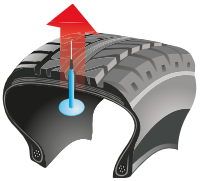
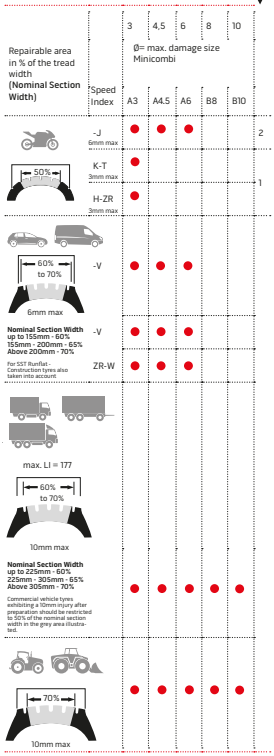
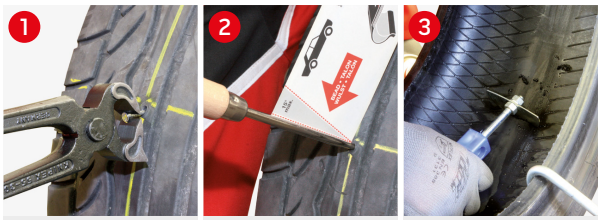
TYRE REPAIR
with REMA TIP TOP MINICOMBI



Maximum number of repairs carried out with MINICOMBI repair plugs in one tyre. Always check whether repairs already carried out in the tyre are defective. Axial distance between repairs: minimum 15 cm/6".

VALID IN ACCORDANCE WITH BS AU 159g:2013



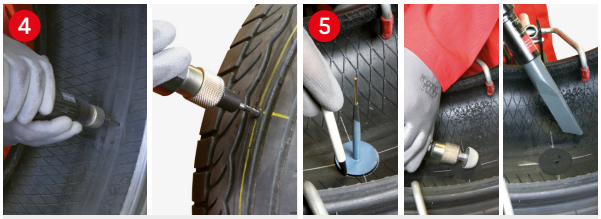


Locate and mark the damage. Take or screw out the foreign object.

*Determine the direction of the puncture channel.

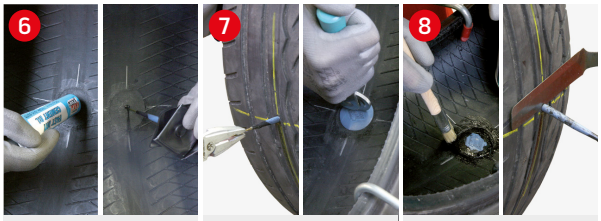
Clean the repair area using LIQUID BUFFER and a scraper.

*NOTE:
For combination plug-patch repair the maximum angle from the perpendicular shall be 15°. For angles greater than this a two piece repair shall be used to a maximum angle of 25°.



Prepare the puncture channel first from the tyre inside outwards, then from the outside to the inside.

Buff the inner liner until you get a completely smooth surface (RMA-2) and clean the buffed area.



Apply CEMENT FD-BL on the buffed surface, fill the puncture channel with fresh cement and immediately insert the MINICOMBI plug.

Pull the MINICOMBI plug outwards as far as possible and stitch the MINICOMBI base.

Seal the MINICOMBI base and any still exposed buffed areas with INNERLINER SEALER, reinflate mounted tyre and then cut the stem.

Tyre Sealant Drivesafe C-Lant

Drivesafe heavy duty tyre sealant is a GEL like consistency which makes the product unique from other products available on the market today

Being a GEL compared to a fluid, the product contains special adhesives which make the gel adhere to the inner tread section of the tyre more effectively and remain in place for the life of the casing

This is far more effective in the event of sustaining a puncture compared to the fluid-based products wash about within the tyre and most often wash away from the puncture wound resulting in deflation.

TYRE PRESSURE MONITORING SYSTEMS

Tyre Pressure Monitoring Systems ('TPMS') are used to check and monitor the air pressure inside a vehicle's tyres. They are designed to enhance vehicle safety and efficiency, using a system that alerts the driver when tyre pressure falls below the minimum value for the vehicle by displaying an alert on the dashboard. These systems can be either Direct or Indirect, depending on the vehicle

TPMS General Information

A tyre pressure monitoring system constantly monitors the pressure and temperature of a vehicle's tyres. If the tyre pressure drops or is below the recommended minimum pressure, the driver is alerted either by an audible signal and/or warning symbol lighting up on the dash, depending on vehicle model. The TPMS system helps to prevent accidents, improve fuel economy and decrease carbon emissions

TPMS & the law in Europe

Commission Directive 2010/48EC confirmed that since November 2012 all NEW type M1 vehicles will be required by law to have a pressure based TPMS (Tyre Pressure Monitoring System) installed. From November 2014 all type M1 vehicles sold in Europe are required by law to have a TPMS system installed (Category M1: Vehicles designed and constructed for the carriage of passengers and comprising no more than eight seats in addition to the driver's seat). TPMS is part of the European National Car test, for all newly registered cars from January 1st 2012.

HSS Cobalt Jobber Drill Bits

ABRACS

Abracs HSS Cobalt Drill Bits are precision ground for high performance. The addition of 5% cobalt into the High Speed Steel increases lifetime, strength & wear resistance, keeping the drill bit sharper for longer. A key performance feature is their Split Point cutting head. The Split Point allows the drill bit to instantly grip the material resulting in higher precision, accuracy and significantly faster drilling speeds.
